ABSTRACT OF THE DISCLOSURE

An autonomous eclone (10) comprises a plurality of interface agents (15,20,25,30) operable to interact with a person; an expert system (35) operable to process a command originated by any of the agents (15,20,25,30); and a database (40) accessible by the expert system (35) and operable to store all available information associated with a user. The eclone (10) also comprises an input authenticator and classifier (45) operable to authenticate and classify the person; a command creator (50) operable to create the command based upon a request; an output action generator (55) operable to execute the command and relay a result to any of the agents (15,20,25,30); and an activity logger (60) operable to log the request and the result. The expert system (35) is essentially a collection of rules that define how the eclone (10) reacts to each request.
